

CloudTask Integrations Guide

Category: Technical | Version: 1.0 | Document ID: integrations_guide

1. Supported Integrations

CloudTask natively integrates with:

- Slack (task notifications and slash commands)
- Google Calendar (due date sync)
- GitHub (link commits and pull requests to tasks)
- Zapier (connect to 3,000+ other apps)

2. Setting Up the Slack Integration

2.1 Go to Settings > Integrations > Slack and click Connect. You will be redirected to Slack to authorize the CloudTask app for your workspace.

2.2 Once connected, you can use the `/cloudtask` command in any Slack channel to create tasks directly from a message.

2.3 Only Workspace Admins and Owners can install or remove the Slack integration.

3. GitHub Integration

3.1 Connecting GitHub requires authorizing the CloudTask GitHub App on the relevant repository.

3.2 Once connected, referencing a task ID (e.g. CT-482) in a commit message or pull request description automatically links it to the corresponding CloudTask task.

3.3 Merging a linked pull request automatically marks the associated task as Done, unless this behavior is disabled in integration settings.

4. Integration Permission Errors

If an integration shows a 'Permission Denied' error, this is usually because the connecting user does not have Admin rights on the external platform (e.g. is not a GitHub repository admin). Reconnecting with an account that has sufficient permissions resolves this.

5. Disconnecting an Integration

Disconnecting an integration from Settings > Integrations stops future syncing but does not delete tasks or links that were already created.
